

Is My Dog Overweight ?

Ideal Weight

- Ribs are easily felt
- Tucked abdomen- no sagging stomach
- Visible waist when viewed from above

Extend your dog's life with proper weight management

Maintaining a dog's ideal weight is far more important than people realize. Less 'baggage' means less stress on sensitive hips and joints. Your dog will be less prone to exercise-related injuries and will be better prepared to head off weight and age-related illness and disease, like arthritis, heart disease and diabetes.

What Can You Do?

Discuss your dog's weight with your vet. If your vet suggests that a weight management program is appropriate:

• Practice Portion Control

Only you can control your dog's food intake. If your dog looks like the lower picture, reduce their intake. Fewer treats!

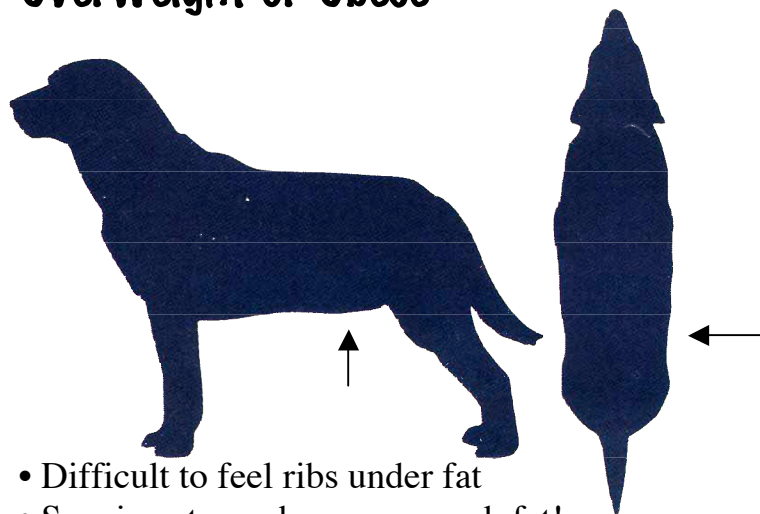

• Get More Exercise

Making sure your dog gets exercise is the best way to help him lose weight. And moderate exercise is actually good for his joints.

• Feed a High Quality Food

Food quality really does matter. Select a high quality, weight-reducing food sufficient in proteins, vitamins and minerals. Feed high-fiber, low-fat and low-calorie foods.

Overweight or Obese

- Difficult to feel ribs under fat
- Sagging stomach-you can grab fat!
- Broad, flat back and no waist
